

Performance Testing

For performance testing, I created a busy servlet to test it. I handled 100 requests with a concurrency of 10 on apache bench, for different number of threads in the threadpool. I found that 10-11 is the ideal size because it takes the minimum time. The time increases on reducing as well as increasing the number of threads. I also tested the threadPool with 10 threads for 1000 requests with the concurrency of 100, with a threadpool size of 10 and it completed in 2143.6 seconds.
